TELNOV D., BUKEJS A., GAILIS J., KALNIŅŠ M., NAPOLOV A., PITERĀNS U., VILKS K., 2010. CONTRIBUTIONS TO THE KNOWLEDGE OF LATVIAN COLEOPTERA. 8. - *Latvijas Entomologs*, 48: 80-91.

Abstract: This paper contains information on 10 new and 144 little known and protected beetle species in Latvia, collected between 1939 and 2009.

Key words: Coleoptera, fauna, Latvia, little-known species.

Introduction

Current publication is a result of studies on Latvian Coleoptera made by Latvian coleopterists in 1939-2009. The aim of the current publication is to improve our knowledge on fauna and ecology of beetles in the Baltic region, with special accent made on poorly known, rare or protected species.

Ten new and 144 little known or protected species of Coleoptera collected are recorded for Latvia. New faunal information on 11 particularly protected Coleopteran species is given. Particular species are new to the whole Fennoscandian region or / and Baltic States (i.e. not mentioned by Silfverberg 2004, Telnov 2004 and later faunal publications on Latvian Coleoptera).

Explanations: E - East, excr. - excrements, house - farmstead or isolated buildings, N - North, NP - National park, num. - numerous individuals (more than 10 if not extra indicated), PNT - protected nature territory, S - South, sur. - surroundings, vill. - village or little settlement, W - West. Common postal country codes are used for countries abbreviations. The number of specimens is given in parentheses after the date of collecting. Species new to the Latvian fauna are marked with an asterisk (*). Species protected in Latvia are marked with a "PS". Some of the abbreviations used ("num.", "sur.", "PNT", "vill.") are not standard English language abbreviations. Baltic states means SE Baltic region (Latvia, Estonia, and Lithuania). Taxa higher than subgenus are listed taxonomically according to Telnov (2004). Species and subspecific taxa are listed alphabetically.

We studied more than 100 specimens of *Leiiopus* collected in Latvia (both – recorded and not recorded above). We were unable to find any specimen of *L. nebulosus* (L., 1758), considered to be very common and widespread in Latvia before *L. linnei* was described. So actually we are unable to confirm occurrence of *L. nebulosus* in Latvian fauna. We will not remove *L. nebulosus* from the list of Latvian Coleoptera, but an additional confirmation is needed for that record. Also possible, that all previously published records of *L. nebulosus* from Latvia are wrong and possible refers to *L. linnei*.

Leiiopus punctulatus (PAYKULL, 1800)
