

## Studies of tiger beetles. CXLIX. Three new species for the fauna of Vietnam (Coleoptera: Cicindelidae)

F. Cassola

Cassola, F. 2004. Studies of tiger beetles. CXIX. Three new species for the fauna of Vietnam (Coleoptera: Cicindelidae). *Zoosystematica Rossica*, **13**(1): 23-27.

Three tiger beetle species, *Therates differens* Sawada & Wiesner, 1999, *Calomera brevipilosa* (W. Horn, 1908) and *Cosmodela separata* (Fleutiaux, 1893), are recorded from Vietnam for the first time. The known tiger beetle fauna of this country is thus raised to a total of 132 species (45, or 34% of which are endemic), what definitely ranges Vietnam among the countries of the world with the richest outstanding entomological biodiversity (km<sup>2</sup>/species ratio: 2.507).

F. Cassola, Via F. Tomassucci 12/20, I-00144 Roma, Italy. E-mail: fabiocassola@skynet.it

Due to heavy long-lasting wars and subsequent political situations, Vietnam is still a poorly explored country, as far as its entomological fauna is concerned. After Walther Horn's (1913, 1914) preliminary lists of species (which, however, were related to the whole of Indochina), updated counts have summed up to 93 the number of tiger beetle species known from Vietnam itself (25 of which endemic to the country) (Pearson & Cassola, 1992). However, a few more species have been described and some additional data have been provided afterwards (Cassola, 2002a, 2000b; Cassola & Probst, 1996; Cassola & Werner, 1995; Deuve, 2002; Naviaux, 1995a, 1995b, 1995c, 1996a, 1996b, 1999, 2002, 2004; Naviaux & Matalin, 2003; Sawada & Wiesner, 1999a, 1999b, 2002; Tscherkasov, 1992; Werner, 1992; Wiesner, 1996). My own reckoning presently indicates a total of 132 species (45, or 34% of which are endemics) (see Table), what definitely ranges Vietnam among the countries of the world with the richest outstanding entomological biodiversity (km<sup>2</sup>/species ratio: 2.507) (Cassola & Pearson, 2000).

During a recent visit to the Zoological Institute of Russian Academy of Sciences, St.Petersburg (ZISP) in November 2003, I had the good opportunity of briefly examining the tiger beetle collection of this institution. Among other things, two species appeared to be new to the fauna of Vietnam, and they are the main subject of this note. One additional species, also new to the Vietnam fauna, was later discovered among unidentified material kindly sent to me by the Institut Royal des Sciences Naturelles de Belgique, Bruxelles, Belgium (IRSNB).

### ***Therates differens* Sawada & Wiesner, 1999**

*Therates differens* Sawada & Wiesner, 1999a: 34.

*Material. N Vietnam:* 1 ♀, Lao Kay (Tonkin), Coll. on Le Moult (IRSNB).

This species was described from northern Laos, but the IRSNB specimen proves it to be present in northern Vietnam too. The identification of the specimen was made by comparison with a paratype specimen in my own collection.

### ***Calomera brevipilosa* (W. Horn, 1908)**

*Cicindela brevipilosa* W. Horn, 1908: 33.

*Cicindela kaiyensis* Kanf & Chô, 1933: 11. *Cicindela brevipilosa klapperichi* Mandl, 1942: 88. *Habrodera (Lophyridia) brevipilosa*: Schilder, 1953: 553. *Lophyridia brevipilosa*: Rivalier, 1961: 132. *Calomera brevipilosa*: Lorenz, 1998: 48; Putchkov & Matalin, 2003: 99.

*Material. SW Vietnam:* 1 ♂, Bay-Tuong, 300 m, 10. VII.1962, Kabakov (ZISP).

This rare species was described from northern China (Schan Tung = Shandong) and was later recorded from other Chinese provinces as well: Tschi Li (= Hebei), Tsche Kiang (= Zhejiang), Fukien (= Fujian) (Horn, 1930), and Gansu (Werner et al., 2002). Mandl (1942) described a ssp. *klapperichi* from Fukien (= Fujian) (Mandl, 1954), later recorded by him (Mandl, 1981) from Zhejiang and Taiwan. The species is known to occur also in North and South Korea (ssp. *kaiyensis* Kanf & Chô, 1933: Kim, 1978; Wiesner, 1992; Putchkov & Matalin, 2003). Useful colour pictures have been published of the holotype of

*C. brevipilosa* (Werner, 1991a, pl. 30), a paratype of *C. b. kaiyaensis* (Werner, 1991b, pl. 31) and a paratype of *C. b. klapperichi* (Werner et al., 2002, fig. 15). However, the validity of these subspecies appears to deserve confirmation, based on larger well-labelled material.

The occurrence of *C. brevipilosa* is SW Vietnam not only considerably enlarges the known geographical range of the species but it seems to strengthen the Taiwanese record as well.

### Cosmodela separata (Fleutiaux, 1893)

*Cicindela separata* Fleutiaux, 1893 : 491.

*Calochroa separata*: Schilder, 1953: 554.

*Cosmodela separata*: Rivalier, 1961: 128; Putchkov & Matalin, 2003: 108.

**Material. W Vietnam:** 1 ♀, Bak-Kuang, 500 m, 14.VII. 1963, Kabakov (ZISP).

This species was described from China ("Che-kiang, Chine boréale, Formose, Shanghai"). Previously, Bates (1872), when describing the closely related *C. velata* from Borneo, had erroneously cited this species as *Cicindela aurulenta* Fabr. var. *flavomaculata* Chevr., 1845, a third congeneric species [in present day taxonomy: *Cosmodela aurulenta juxtata* (Acciavatti & Pearson, 1989)]. All these species were later moved to the genus *Cosmodela* by Rivalier (1961). Horn

(1926) summarized the geographical range of *C. separata* as follows: "Das Gebiet zwischen Shanghai, Yünnan u. Fu-Kien". Mandl (1954) recorded it from "Kwangtseh, Shaowu und den Kuatunbergen", and later (Mandl 1981) again from Zhejiang. More recently, Wiesner (1992) indicated the following distribution: "China: Ki-ang Su (= Jiangsu), Tsche Kiang (= Zhejiang), Yun Nan (= Yunnan), Fu Kien (= Fujian)", and Putchkov & Matalin (2003) did the same. Thus, the general known distribution indicates this species to inhabit the whole of southern China. However, as to the occurrence of *C. separata* in Taiwan (Formosa), firstly quoted by Fleutiaux himself (1893), it was not confirmed by Werner et al. (2002).

Compared to several specimens (in my own collection) from several Chinese localities (Zhejiang: Wenzhou, Siming-shan; Foochow to Kuatun), this Vietnamese specimen (incorrectly labelled in ZISP collection "*Cicindela oberthuri* Fleut., Kabakov det. II.1964") has green, instead of cupric-red, metallic parts of head, pronotum and elytra, and as a matter of fact it is a bit reminiscent of *C. fleutiauxi* (W. Horn, 1915) (= *oberthueri* Fleutiaux, 1893). However, the individual or subspecific value of such characters cannot, of course, be determined based on a single specimen only.

Notes. \* Endemic.<sup>a</sup> Described from "Cochinchine", thus from southern Vietnam. <sup>2</sup> Endemic subspecies. <sup>3</sup> Described from peninsular Malaysia, this species is not known from the intervening areas. Therefore, this record deserves confirmation. <sup>4</sup> Recorded from Vietnam (Chapa), most probably erroneously (Cassola, 2002b).

### Acknowledgements

I am very grateful to Alain Drumont (IRSNB) for submission of unidentified material, among which I have found the first species listed above. Warm thanks are also to be given to Boris M. Kataev and Mark G. Volkovitsh (ZISP) for their friendly reception and kind assistance during my short visit to their Institute.
