Abstract

A checklist with critical data is provided for all primary types ($n = 48$) of the families Cerylonidae, Endomychidae and Latridiidae deposited in the National Museum of Natural History. Of those, 43 holotypes, 3 lectotypes, and 2 neotypes are represented. This tally includes a lectotype for *Geoendomychus punctatus* Arrow (1926) and neotype for *Rhymbomicrus stephani* Pakaluk (1987), both newly designated to promote nomenclatural stability. Fifteen species have at least one paratype, paralectotype, or authoritatively identified non-type specimen associated with the holotype. Type specimens were compared to the original species descriptions to confirm their status, verbatim label data were recorded, and barcode labels were added. In addition to cataloguing the types, notes were made where discrepancies exist between the data labels pinned with the types and the data published with the original species descriptions.

Key words: Cerylonidae, Endomychidae, Latridiidae, USNM types, catalogue
